

Apollo's Orchestra Final Presentation

Presented by Eduardo Ramos & Lucas Sousa

Context

For this project we decided on developing a music database that provides a rich collection of information, including detailed profiles of artists, albums, singles, and record labels.

It also categorizes music by genres, highlights the role of instruments, and features an extensive archive of songs and recordings.

Features Implemented

Functional Requirements

Technical Features

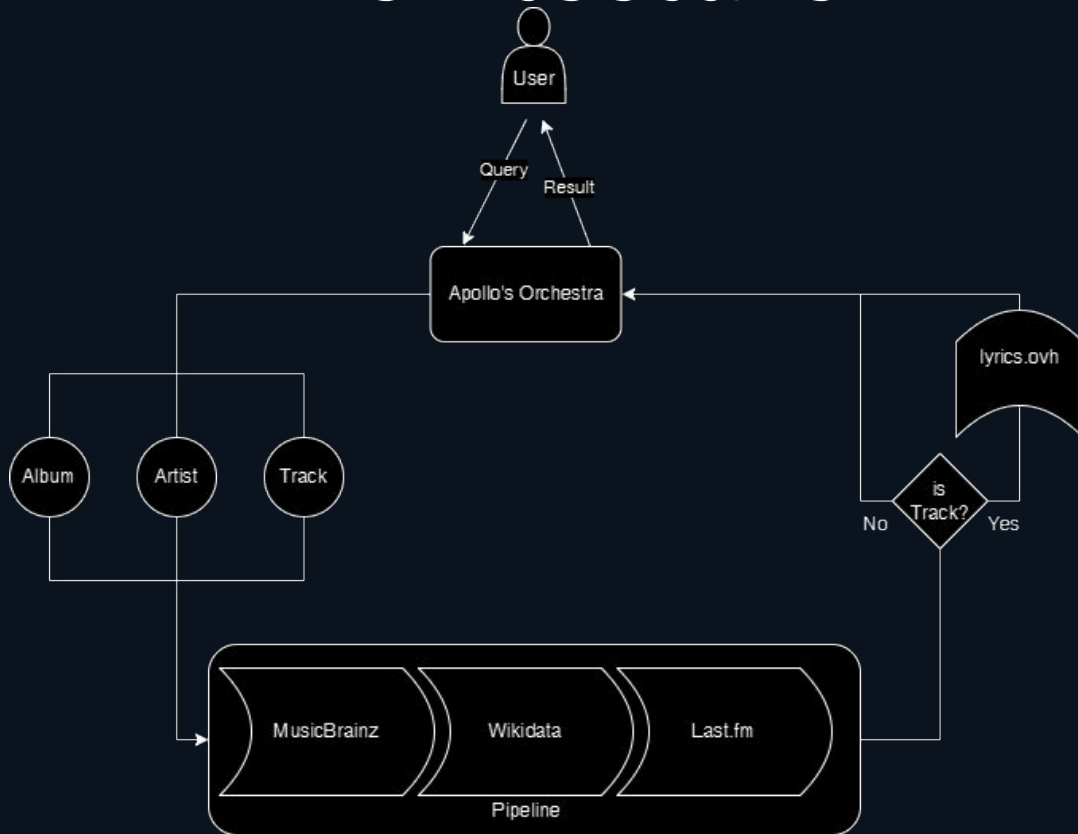

- 01 Data Retrieval
- 02 Data Linking

- 01 Data Integration
- 02 Search Capabilities
- 03 Data Presentation
- 04 Ontology Design
- 05 RDF Support

Non-Functional Features

- 01 Data Consistency
- 02 Interoperability
- 03 API support

Architecture

Ontology

Knowledge Bases Used

MusicBrainz
API

LYRICS.OVH
ONLY THE LYRICS

Lyrics.ovh
API

WIKIDATA

WIKIDATA
API

Last.fm
API

AcousticBrainz
API

Challenges

Data Inconsistency

Data was stored inconsistently across different knowledge bases, in some cases, even within itself.

Data Incompleteness

Some information was missing from lots of entries. And that problem aggravated for lesser known artists or tracks

Defining Concepts

Our solution had to be able to handle differences in the definition of music concepts:
Group or single artist, album or release, etc.
